comma CMMS API Home
What is the sensorNET project?

The sensor NET project is the open source development of code that runs on [arduino](#) and arduino compatible boards and that is designed to interact with the [comma CMMS API](#).

This is mainly intended for the generation work requests based on actual on-field conditions.

For example, the arduino can be equipped with a temperature sensor and will issue a comma CMMS work request automatically when the temperature raises above a certain value.

Follow the development of the code + how-tos at the sensorNET github page available [here](#).
